4. ἐσ τὸ ἄνω] C, om. B. 5. ἀνοισεῖται]

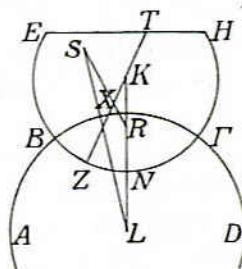

et eadem si a magnitudine, in qua Λ, sursum trahitur, magnitudo autem, in qua Λ, quoniam leuior est humido, tanta si sursum referetur, quanta est grauitas Γ; demonstrauimus enim, solidas magnitudines humido leuiores in humidum depressas tanta si sursum referri, quanta sit grauitas, qua humidum molem habens aequalem magnitudini grauius sit magnitudo [prop. VI], humidum autem molem habens aequalem magnitudini Λ grauius est magnitudo Λ grauitate Γ. ergo adparet, etiam magnitudinem, in qua Λ, tanta grauitate deorsum ferri, quanta sit Γ.

Supponamus, omnes magnitudines, quae in humido sursum ferantur, secundum perpendicularē per centrum gravitatis earum ductam sursum ferri.

## VIII.

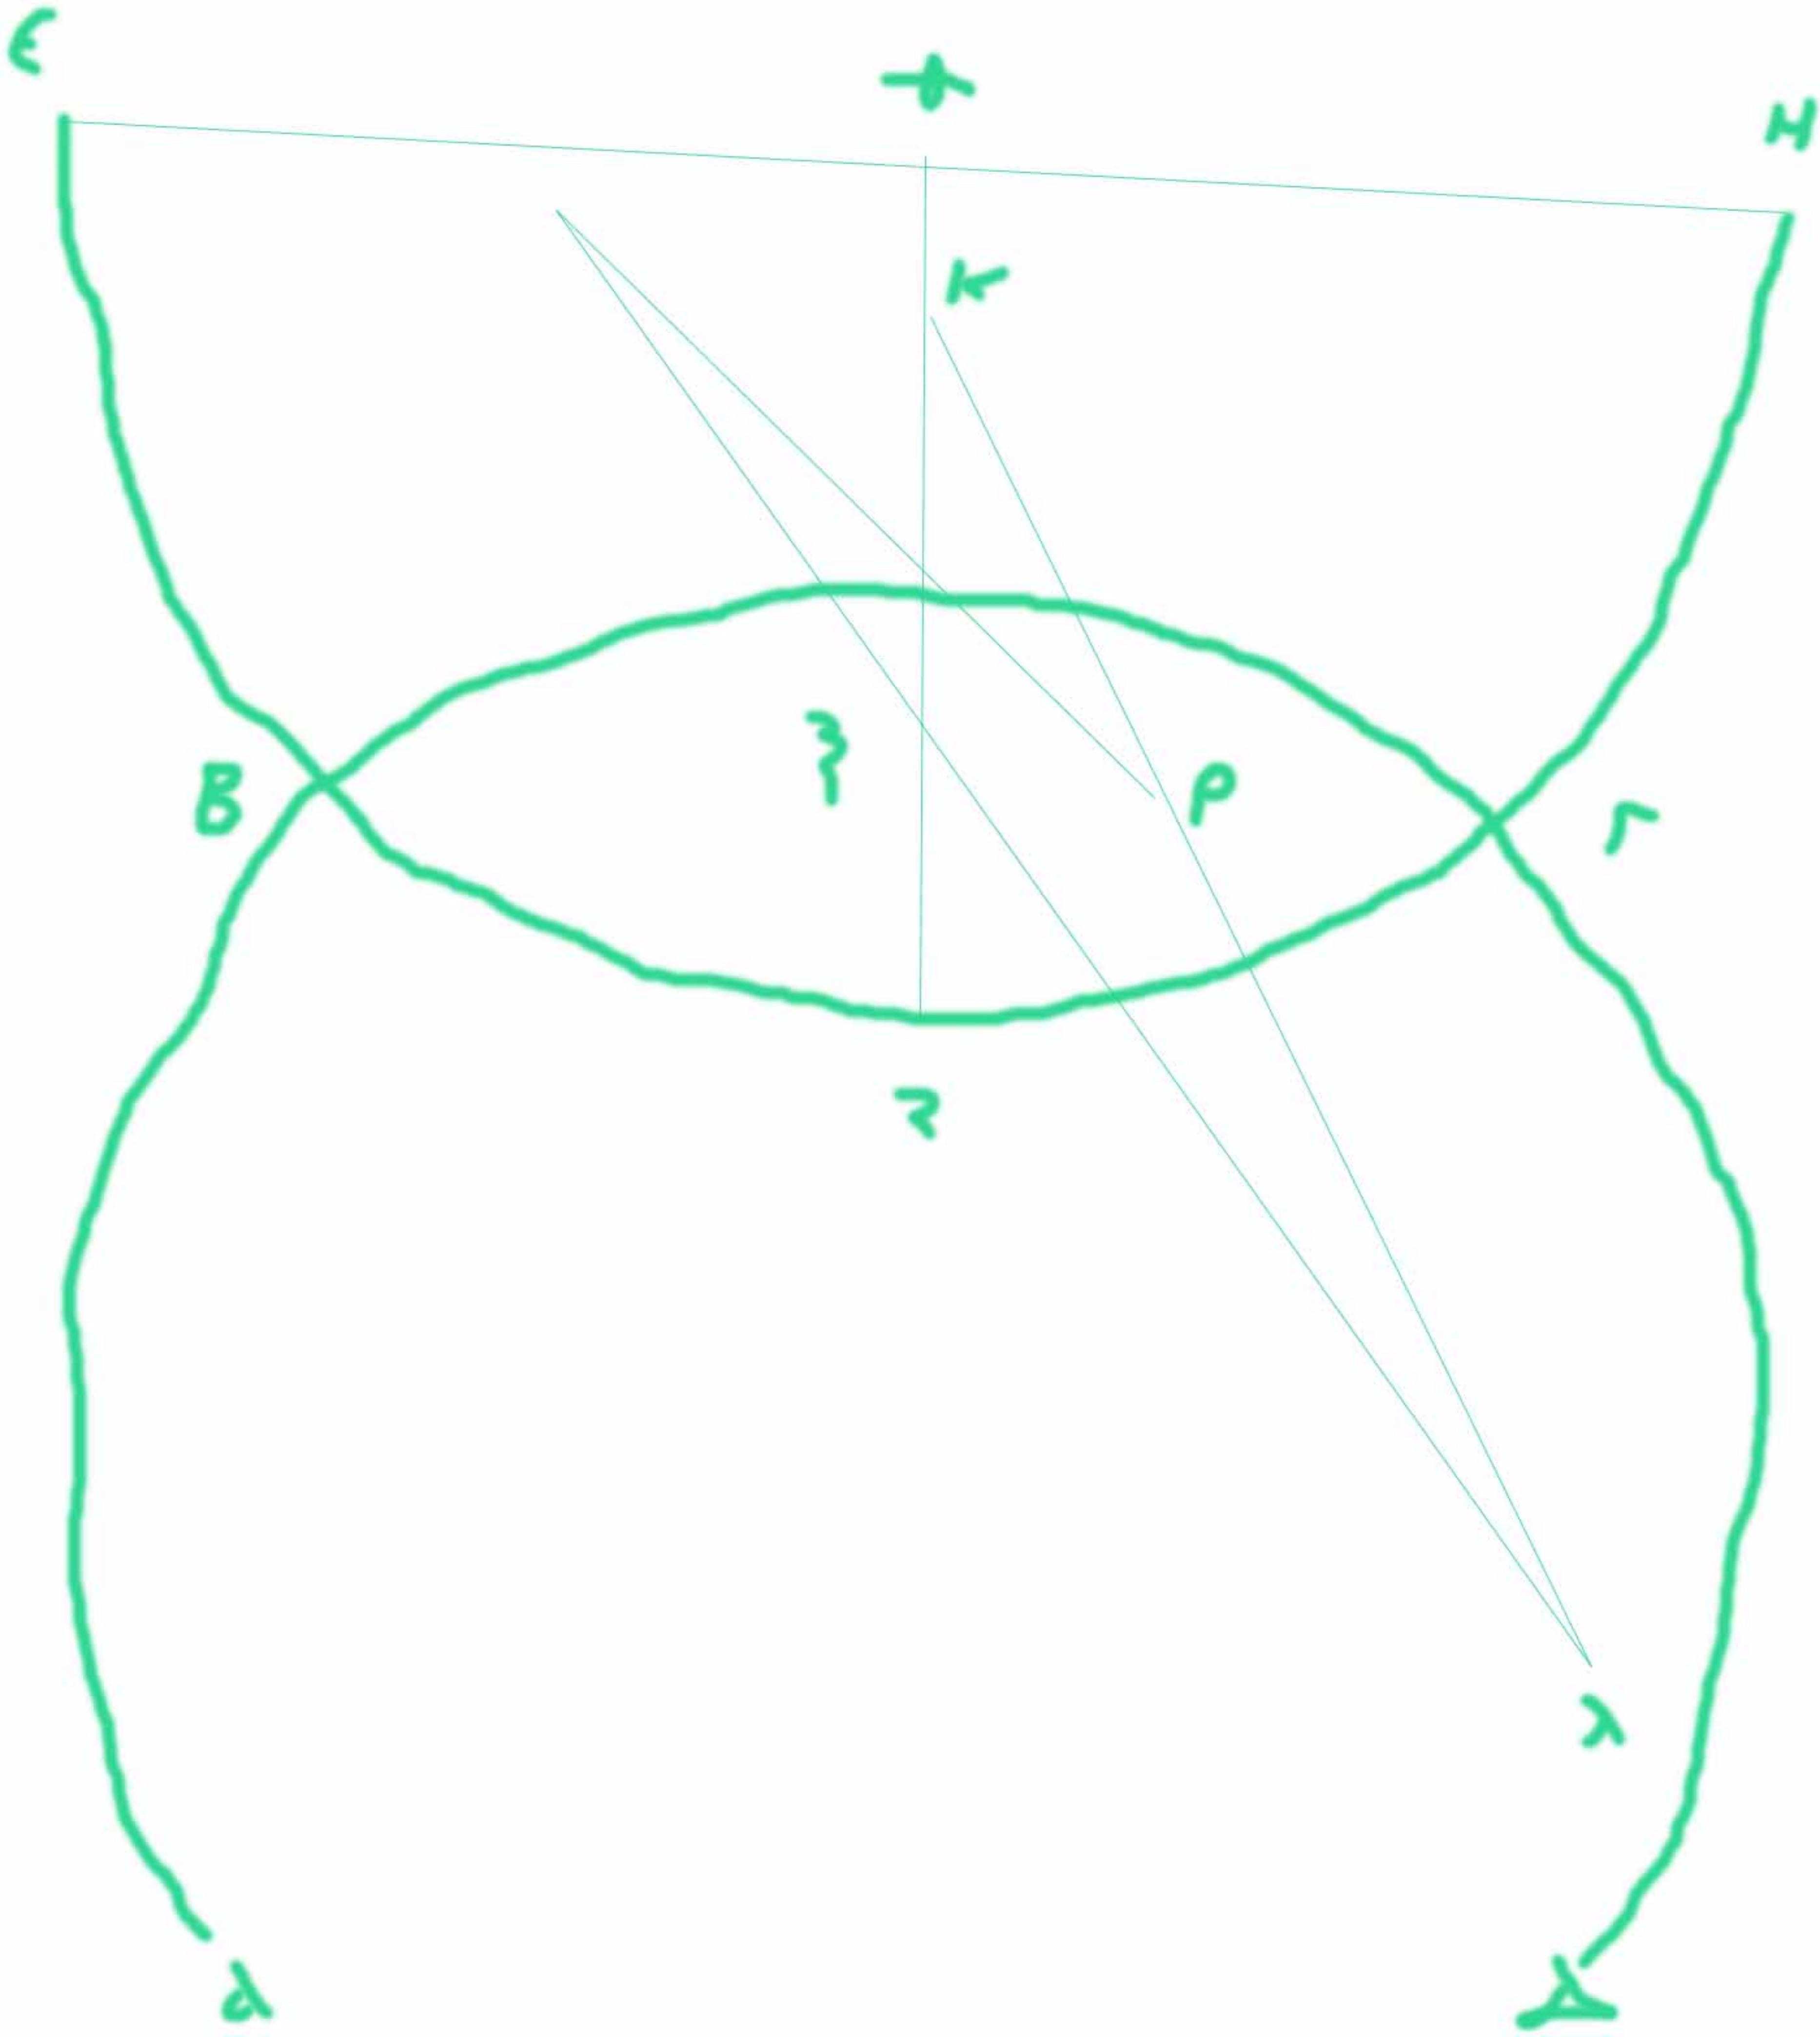

Si solida aliqua magnitudo humido leuior, quae figuram segmenti sphaerae habet, in humidum ita demittitur, ut basis segmenti humidum non tangat, figura recta constituetur ita, ut axis segmenti perpendicularis sit; et si qua si trahitur figura ita, ut basis segmenti humidum tangat, non manebit inclinata, si dimittitur, sed recta restituetur.

figatur enim magnitudo aliqua, qualis dicta est, in humidum demissa, et per axem segmenti centrumque
