# Motivation

In Practice:

Diagonalization of the Hamiltonian of strongly correlated systems in large Hilbert space  $\mathcal{H}^{(N)}$ .

- ▶ **Alternative** : Use a projection technique to reduce the size of Hilbert space. Practically reduce the size of the Hamiltonian matrix.

(H. Feshbach, Nuclear Spectroscopy part B (1960), Academic Press)

- ▶ Study the properties of the low excited states of microscopic strongly correlated systems at  $T = 0$ .
- ▶ Study the properties of the system near the first or higher critical points in the spectrum.

(W.D.Heiss, Phy.Rev.E61(2000), 929)

(Sachdev, Quantum Phase Transition, Cambridge)

# Renormalization in Hilbert space at $T = 0$

The Hamiltonian:

$$H = H_0 + gH_1, \text{ with } H_0|\Phi_i^{(N)}\rangle = \epsilon_i|\Phi_i^{(N)}\rangle, i = 1, \dots, N$$

Using the feshbach formalism, we can write the Hilbert space  $\mathcal{H}^{(N)}$

$$\mathcal{H}^{(N)} = P\mathcal{H}^{(N)} + Q\mathcal{H}^{(N)}$$

$$\dim P\mathcal{H}^{(N)} = N - 1, \quad \dim Q\mathcal{H}^{(N)} = 1$$

with  $P$  and  $Q$  are the projection operators.

In the projected subspace  $P\mathcal{H}^{(N)}$  :

$$H_{\text{eff}}(E) = PHP + PHQ(E - QHQ)^{-1}QHP$$

$$\text{with, } P|\Psi_1^{(N)}\rangle = \sum_{i=1}^{N-1} a_{1i}^{(N)}(g^{(N)})|\Phi_i^{(N)}\rangle$$

So,  $H_{\text{eff}}(E_1^{(N)})P|\Psi_1^{(N)}\rangle = E_1^{(N)}P|\Psi_1^{(N)}\rangle$

$H_{\text{eff}}$  is projected on  $\langle\Phi_1|$ :

$$\langle\Phi_1|H_{\text{eff}}(E_1^{(N)})|P\Psi_1^{(N)}\rangle = E_1^{(N)}(g^{(N)})a_{11}^{(N)}(g^{(N)}) \quad (I)$$

- ▶ At this point, we begin the reduction procedure  $\mathcal{H}^{(N)} \longrightarrow \mathcal{H}^{(N-1)}$
- ▶ We renormalize  $g$  by defining  $H^{(N-1)} = H_0 + g^{(N-1)}H_1$  acting on  $\mathcal{H}^{(N-1)}$ .
- ▶ we impose the constraint:  $E_1^{(N-1)} = E_1^{(N)}$

Developing Eq.(1). One gets a discret quadratic flow equation:

$$a^{(N-1)}g^{(N-1)^2} + b^{(N-1)}g^{(N-1)} + c^{(N-1)} = 0$$

where

$a^{(N-1)}$ ,  $b^{(N-1)}$  and  $c^{(N-1)}$  are functions of  $\{E_1^{(N)}, a_{1i}$  and  $\langle \Phi_i | H | \Phi_j \rangle, i = 1, \dots, N\}$

- ▶ **This method could give information about the excited states**

## Algorithm :

- 1– Compute the elements of the Hamiltonian matrix  $H^{(N)}$  by arranging the diagonal ones in increasing order.
- 2– Use the Lanczos technique to determine  $E_1^{(N)}$  and  $|\Psi_1^{(N)}(g^{(N)})\rangle$ .
- 3– Compute the flow equation of  $g^{(N-1)}$  and take the value nearest to  $g^{(N)}$  by continuity.
- 4– Build  $H^{(N-1)}$  by elimination of the element  $H^{(N)}$  corresponding to the state  $|\Phi_N\rangle$ .
- 5– Repeat the same procedure 2, 3 and 4 by fixing at each step  $E_1^{(K)} = E_1^{(K-1)}$ .
- 6– Continue the iterations up to a low dimensional  $k = N_{min}$ .

# Application to spin ladders

The Hamiltonian of  $s = 1/2$ :

$$H^{(s,s)} = J_t \sum_{i=1}^L s_{i_1} s_{i_2} + J_l \sum_{\langle ij \rangle} s_{i_1} s_{j_1} + J_l \sum_{\langle ij \rangle} s_{i_2} s_{j_2} + J_c \sum_{(ij)} s_{i_1} s_{j_2} + J_c \sum_{(ij)} s_{i_2} s_{j_1}$$

Here:  $H_0 = 0$  and  $g^{(N)} = J_t$

Renormalization in Hilbert space at  $T = 0$

Algorithm

Application to spin ladders

Conclusions

Perspectives

- ▶ The renormalization is restricted to a unique coupling strength.

$$H^{(N)} = g^{(N)} H_1$$

$$H_1 = \sum_{i=1}^L s_{i_1} s_{i_2} + \gamma_{tl} \sum_{\langle ij \rangle} (s_{i_1} s_{j_1} + s_{i_2} s_{j_2}) + \gamma_{1c} \sum_{\langle ij \rangle} s_{i_1} s_{j_2} + \gamma_{2c} \sum_{\langle ij \rangle} s_{i_2} s_{j_1}$$

where  $\gamma_{tl} = J_l/J_t$ ,  $\gamma_{1c} = J_c/J_t$  and  $\gamma_{2c} = J_c/J_t$ .

- ▶ These quantities are kept constant and  $g^{(N)} = J_t$  will be subject to renormalization in the reduction process.

$L = 12$  sites,  $J_t = 15$ ,  $J_l = 5$ ,  $J_c = 3$ ,  $S_{tot}^z = 0$

$$p(i) = \left| \frac{(e_i^{(N)} - e_i^{(n)})}{e_i^{(N)}} \right| \times 100$$

$$n/N \sim 0.067$$

$$p(1) \sim 0.8\%$$

$$p(2) \sim 0.8\%$$

$N$  is the dimension of the Hilbert space. *Amplitudes* show the number of relevant -irrelevant amplitudes in the ground state eigenfunction. Relevant amplitudes are those for which  $\{a_{1i} > \epsilon, (\text{here } \epsilon = 10^{-2}), i = 1, \dots, n\}$

Dimensional reduction procedure in Hilbert space. Application to strongly correlated systems

Tarek Khalil

Introduction

Motivation

Outline

Renormalization in Hilbert space at  $T = 0$

Algorithm

Application to spin ladders

Conclusions

Perspectives

# Conclusions

- ▶ The stability of the low-lying states of the spectrum in the course of the reduction procedure depends on the relative values of the coupling strengths.
- ▶ The evolution of the spectrum depends on the initial size of Hilbert space.
- ▶ Local spectral instabilities appearing in the course of the reduction procedure are correlated with the elimination of basis states with sizable amplitudes in the ground state wavefunction.
